have a good conceptual model

"A good conceptual model allows us to predict the effects of our actions. Without a good model we operate by rote, blindly; we do operations as we were told to do them; we can't fully appreciate why, what effects to expect, or what to do if things go wrong."

– Donald A. Norman,

The Design of Everyday Things

what we do

analyses

whiteboards

playgrounds

user research

Summary

Design a pithy idea workflow.

Status

Call for Proposals	Analyzing Proposals	Shaping Tentative Design	Implementation in Progress	Implemented

Scope

In Scope	Out of Scope
• Easy to browse through • Terse phrases • Space for multiple proposals	• Development tracking

Relevant Bugs

- Bug example

Definition of Terms

- **Whiteboard:** A wiki page for the purpose of developing a design idea into a full-blown specification.
- **Scope:** A list of qualities the final design should have. The scope should be broad enough to restrict proposals as little as possible.
- **Bug:** A software flaw that produces an incorrect or unexpected result.
- **Persona:** A made-up person who represents our common user. The way he uses LibreOffice helps shape the way we design our feature.

Discussion

- LibreOffice Design List

Personas

- **Mr. Persona**: A made-up user that represents the norm we want to design for. He does tasks similar to those of a

Open Problems

Presentation of Slide Notes

In the same view as slide thumbnails	In a separate view
• Allows the user to see the slide as well as the notes that accompany it simultaneously. • Doesn't require a tab bar (useful if we want to use the slide gesture to advance slides)	• Make it possible to present a bigger preview of the slide and more of the notes.

Final decision: In the same view as slide thumbnails

Advancement of Slides

The following are non-exclusive, and we may choose a combination of solutions.

Using on-screen buttons	Using a slide gesture	By tapping on the slide thumbnail or notes
• Allows the use of a tab bar for a slide gesture. • Doesn't have to be explained to the user in advance. • Makes it possible to navigate both back and forward.	• Makes it possible to advance the slide without looking at the screen. • Makes it possible to navigate both back and forward. • Intuitive to touch users, who use the same gestures for moving between photos.	• Familiar to desktop users

Final decision: Using a slide gesture

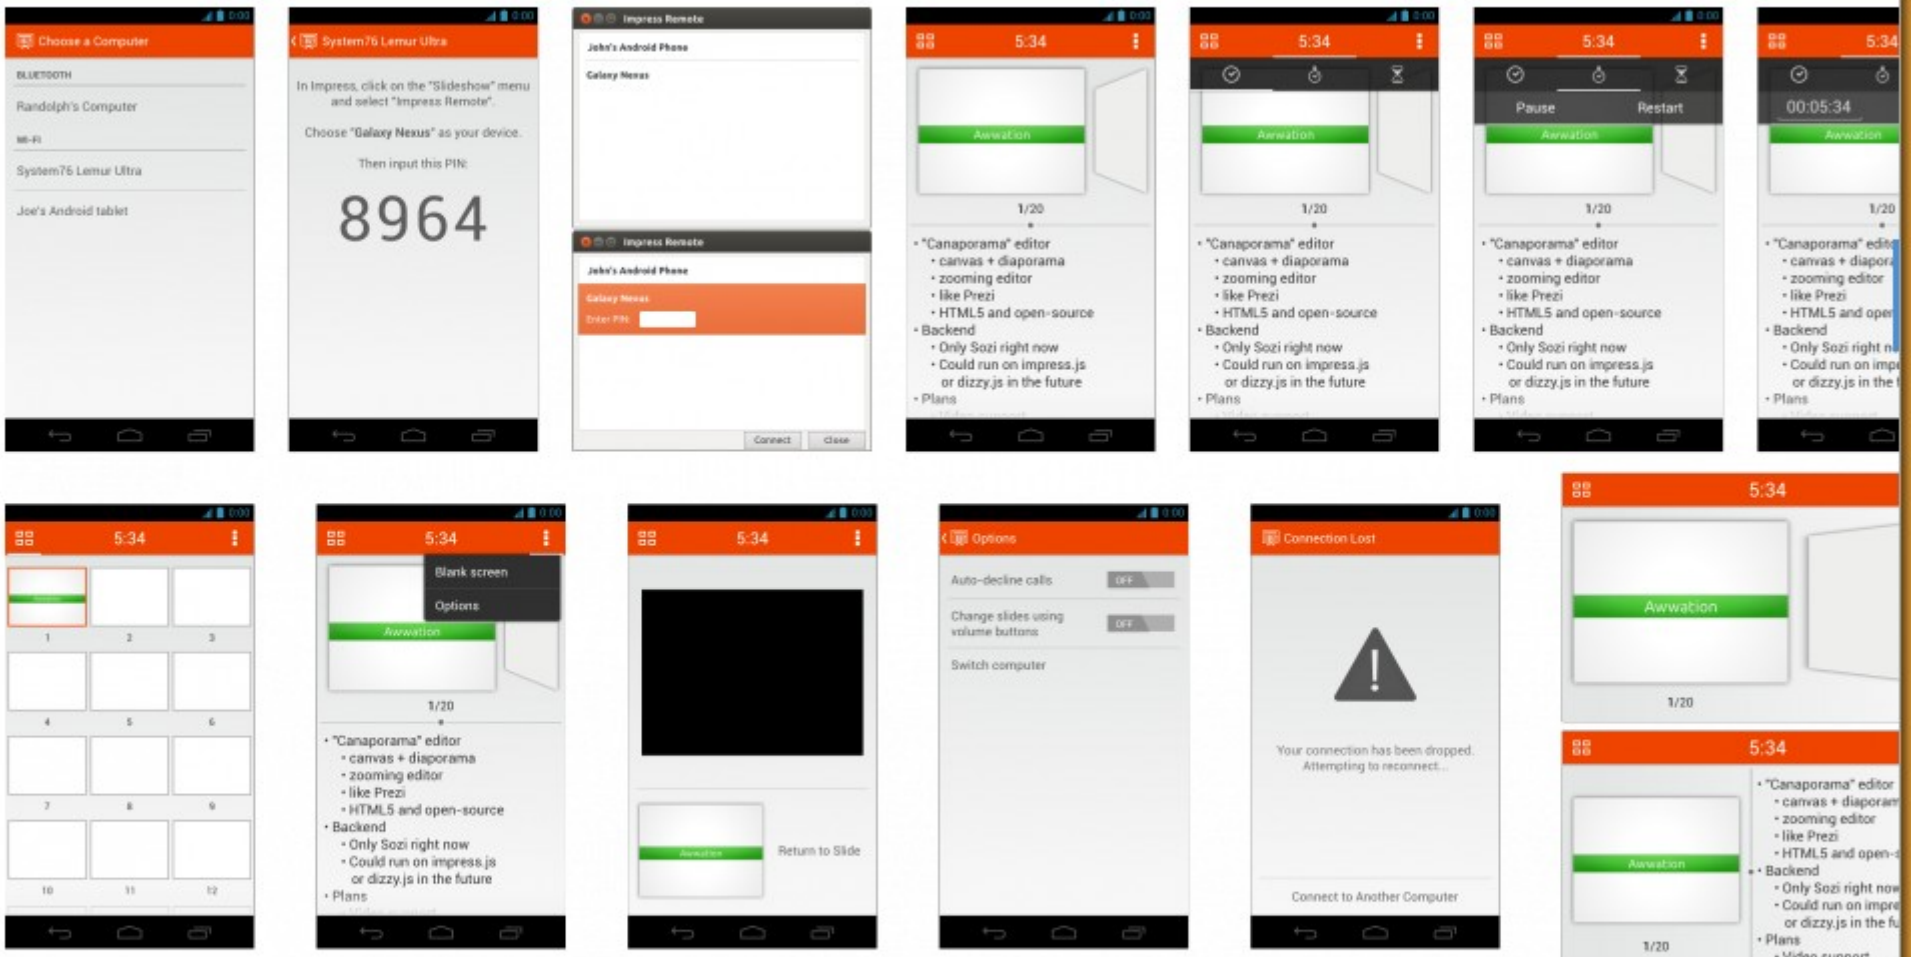
Portrait vs. Landscape Mode

Show the same info	Use different views
• Consistent	• Fast view change • Presenter doesn't have to look at the screen to change

wiki.documentfoundation.org

http://wiki.documentfoundation.org/Design/Whiteboards/Impress_remote#Tentative_Design

Tentative Design



Connecting to a computer

If the connection was forcefully disconnected (Via the modal bar) after the last time the remote was used one should need to enter a new PIN. Otherwise the app should try to reconnect using the last settings. Same goes for the PC.

The first screen the app shows is the one to select computers that the cell can connect to via wlan or bluetooth. Then the user can generate a PIN on the phone and enter it on the PC. Those set-up screens can be reached via the
